

Academic System Guide

AU-ESET 301 | Revision 2.1 / v15.8 | September 2026

Your course supports CETa preparation and practical electronics/test-technician skills, with a longer path toward embedded systems engineering. The university setting is a familiar place to return to the work; it does not award accredited credit.

Begin here

Open **Study**. Resume a saved session first, or start the recommended next action. Follow the assigned booklet reading and task. Supporting resources are available when you need another explanation, not another required course.

Study	What should I do now? Guided work, review, Quiet/Focus and resume.
Week	What am I learning this week? Outcomes, instructions and resources.
Calendar	When is it scheduled? Month, Week and Agenda with event details.
Practice	Choose Lab Center or Assessment Center.
Progress	Completion, notes, career gates, backup and Cloud Sync.
Mastery	Current web evidence, retention and repair priorities.

Where everything else lives

More contains Course Overview, Engineering, Engineering Library, Projects, Search Everything, Knowledge Base, Labs, Assessments, Standards, Documents, Student Services, About and Release Notes. Click More; scroll inside it on a short screen. Mobile uses a scrollable navigation drawer.

Use **Search** to find material across the site. Use **Knowledge Base** for a concise concept explanation. Use **Library** for deliberate reference browsing. Release Notes also remains under About.

A manageable study routine

1. Choose a work block

Quick: 20 minutes. Standard: 60 minutes. Deep Work: 120 minutes. These are plans, not forced completion deadlines. A full assignment can span several blocks. Take a break at a safe stopping point.

2. Follow the visible steps

Recall what you know, learn from the assigned material, apply it, then prove what you can explain or do. Save a short **next-action note** when interrupted. Closing an unfinished session preserves your place and does not complete the assignment.

3. Finish deliberately

Mark scheduled work complete only after doing the assignment and meeting its outcomes. A correct calculation, measured result, working circuit/code result or troubleshooting explanation is useful evidence. Watching or clicking through pages alone is not completion.

If focus becomes difficult

Quiet Mode reduces decorative distractions. **Focus Mode** concentrates on the active Study workspace. Both preserve the course content. **I'm Stuck** offers a smaller explanation, worked examples, the Week Module or a parking-lot note for a side question.

Use **Resume** to return to your saved step and note. The next-action note, local session and parking lot belong to this browser. You do not need to recreate them as a second checklist.

Review without creating another backlog

Green/Yellow/Red confidence schedules retrieval. It does not certify mastery or complete coursework. Review is offered in blocks of up to three; stop there or deliberately choose another block. Standards/Analytics can send a competency into the same Study review queue.

Read the calendar in layers

Use Agenda for a readable list, Week for nearby work, and Month for orientation. Open an event for today's work and outcomes; expand reference notes when needed. Equipment reminders prepare you for learning and are labeled separately. Current Week follows instructional dates.

Preparation that reflects real ability

CETa: keep the booklet first

Use your own sixth-edition Associate CET study booklet, its unit questions/reviews and practice exams, plus current ETA competencies and errata. The private booklet is not published in Alfred's website files.

The active web bank has **223 supplementary questions: 180 CETa and 43 career**. It directly tags 111 of 262 listed CETa objective rows; the other 151 are not directly sampled. Parent and sub-objective rows are separate, not official exam weights.

The 100-question breadth form uses five per domain and a suggested 120-minute window. That is Alfred's study design, not ETA's exam weighting. Forms reuse a finite bank. Repeated high scores can reflect familiarity; use less-familiar problems and explain your reasoning without answer cues.

Scores, completion and mastery answer different questions

Progress records what you completed. **Assessment scores** show how you performed on particular forms. **Standards and Mastery** summarize the evidence the site has. None is a certification or hiring prediction.

v15.8 keeps older scores but treats earlier mixed-question aggregates as historical evidence. **Revalidation Needed** means fresh current-bank evidence is needed; it does not reset completed coursework or mean you forgot everything. Low coverage may be unmeasured knowledge, not failure.

Career skills need practical evidence

Use labs and projects to practice schematics, safe measurement, fault isolation, repeatable testing and technical reporting. A useful record explains the problem, setup, expected result, measured result, correction and verification.

Virtual labs support reasoning. Physical probe handling, soldering, workmanship and board debugging require physical practice and evidence. The Lab Center keeps virtual and physical completion separate. Work within your training, equipment ratings and lab safety instructions.

The manual career gates remain useful for real projects, a professional package and a suitable job offer. Continue school and employment according to your circumstances; a website score does not justify a career decision by itself.

Keep your work safe

Backup and Cloud Sync

Progress saves locally first. Optional Cloud Sync uses the production Alfred Worker and D1 record. Normal setup needs your private **Recovery / Student Sync Key**; the server address is already supplied. Advanced server settings are for maintenance.

Export Backup saves academic progress, not the Recovery Key. Keep the key separately. **Import** confirms replacement of local progress and does not silently change your cloud credentials. Sync before switching devices; avoid editing the same record on multiple offline devices at once.

Cloud notes are not end-to-end encrypted. Anyone with the Recovery Key can access the record. Do not put that key, passwords, private backups or the private study booklet in the public GitHub repository.

Reset is different from cloud erasure

Local reset clears academic progress and saved Study state on this device, then disconnects sync. It preserves the key and the cloud record; reconnecting can restore cloud data. **Erase Cloud Record** is a separate permanent action. Do not use it as a normal update step.

Upload and offline use

Before updating, export Progress and retain your key. Extract the complete flat ZIP and upload all files together beside index.html in the existing repository root. Do not upload a wrapper folder. Keep the same site address and GitHub Pages settings. No Worker or D1 migration is required for v15.8.

Do not clear browser site data to refresh the website. Close older tabs and reopen after deployment. Check Release Notes for v15.8. App-cache updates do not require erasing learner records.

Visit needed pages/documents online before relying on offline access. External videos, publisher pages and online simulators still need the internet. Browser storage limits or eviction can remove cached resources; keep backups.

Which documents govern current use?

This guide governs the current website workflow. The syllabus, lab/resource manuals and career checklist remain useful supporting material. The old binder's gradebook, hours-log and evidence-upload workflow is archived. No mandatory spreadsheet gradebook or manual weekly mastery rating is required.
